

ABSTRACT OF THE DISCLOSURE

5 A technique for correcting the voice spectral
deformations introduced by a communication network.
Prior to the operation of equalisation of the voice
signal of a speaker, the constitution of classes of
speakers is communicated, with one voice reference per
class. Then, for a given speaker, the classification of
10 this speaker is communicated, that is to say his
allocation to a class from predefined classification
criteria in order to make a voice reference which is
closest to his own correspond to him. Then, for that
given speaker, communicating the equalisation of the
15 digitised signal of the voice of the speaker carried
out with, as a reference spectrum, the voice reference
of the class to which the speaker has been allocated.
This technique applies to the correction of the timbre
of the voice in switched telephone networks, in ISDN
20 networks and in mobile networks.
